

Strudes News

The most modern and largest Cement Terminal in North America is now being commissioned. This Terminal was constructed on Zug Island in Detroit, Michigan, for Lafarge North America.

The Terminal comprises an eleven compartments, 46,000-ton capacity silo, ship unloading and rail unloading facilities and a warehouse with packing and palletizing production lines.

Three bulk truck loading spouts and scales allow for a simultaneous loading of three trucks in 6 minutes each.

The in-line blending system of a few products allows for a modern cementitious material blending and loading on trucks.

Strudes' Engineers designed this Complex and the construction was done by Graycor Constructors.
